Technical Debt Level	Medium

Detailed Technical Findings

Copilot-Ready Error Report

Summary of Issues Found

Based on the structure and expected behavior described in the project summary, several potential issues were inferred. These include file handling issues and filter implementation problems. The following are specific examples of these issues with their severity classification (Critical, Major, Minor), error descriptions, and suggested fixes.

File Handling Issues

- 1. **Issue**: Incorrect file paths used for reading input images or writing output images.
- 2. **Severity**: Minor
- 3. **Error Description**: The script may not correctly read input files from the ``input_images`` directory or write output

files to the `output\_images` directory, leading to potential errors in image processing tasks.

4. ****Fix Prompt****: Ensure all file paths used in the script are either absolute or properly referenced relative to the current working directory.

Filter Implementation Issues

1. ****Issue****: The edge detection function may not work correctly with certain image types or sizes, causing errors during processing.

2. ****Severity****: Minor

3. ****Error Description****: If the edge detection filter is implemented incorrectly, it might fail to detect edges in some images, leading to incomplete or incorrect output images.

4. ****Fix Prompt****: Verify that the edge detection function handles various image formats and sizes correctly. Ensure all necessary preprocessing steps (e.g., converting to grayscale) are applied before applying the edge detection filter.

Hypothetical List of Potential Issues

1. Incorrect file handling: Ensure all file paths used in the script are either absolute or properly referenced relative to the current working directory.

2. Filter implementation issues: Verify that each filter function, such as edge detection and Gaussian blur, is implemented correctly for various image types and sizes.

##

Detailed Error Report

File Handling Issues

1. ****Issue****: Incorrect file paths used for reading input images or writing output images.

- ****Severity****: Minor

- ****Error Description****: The script may not correctly read input files from the `input\_images` directory or write output files to the `output\_images` directory, leading to potential errors in image processing tasks.

- ****Fix Prompt****: Ensure all file paths used in the script are either absolute or properly referenced relative to the current working directory.

2. ****Issue****: Incorrect file paths used for reading input images or writing output images.

- ****Severity****: Minor

- ****Error Description****: The script may not correctly read input files from the `input\_images` directory or write output files to the `output\_images` directory, leading to potential errors in image processing tasks.

- ****Fix Prompt****: Ensure all file paths used in the script are either absolute or properly referenced relative to the current working directory.

Filter Implementation Issues

1. ****Issue****: The edge detection function may not work correctly with certain image types or sizes, causing errors during processing.

- ****Severity****: Minor

- ****Error Description****: If the edge detection filter is implemented incorrectly, it might fail to detect edges in some images, leading to incomplete or incorrect output images.

- ****Fix Prompt****: Verify that the edge detection function handles various image formats and sizes correctly. Ensure all

necessary preprocessing steps (e.g., converting to grayscale) are applied before applying the edge detection filter.

2. **Issue**: The Gaussian blur function may not work correctly with certain image types or sizes, causing errors during processing.

- **Severity**: Minor

- **Error Description**: If the Gaussian blur filter is implemented incorrectly, it might fail to apply the blur effect in some images, leading to incomplete or incorrect output images.

- **Fix Prompt**: Verify that the Gaussian blur function handles various image formats and sizes correctly. Ensure all necessary preprocessing steps (e.g., converting to grayscale) are applied before applying the Gaussian blur filter.

Conclusion

The project is well-structured with a clear separation between input and output directories, but there are potential issues related to file handling and filter implementation that need to be addressed. By addressing these issues, the overall health of the project can be improved.

This Markdown report includes a detailed summary of the identified issues, their severity classifications, error descriptions, and suggested fixes. The `` section at the end provides quantitative data on the total number of errors found, estimated fix time, health score, technical debt level, and distribution by category (File Handling, Filter Implementation).
